

1. Omissions: What the AI model did not ask about

Based on the currently generated outputs that the AI provided, here is currently a list of what was not asked of the model:

- The AI model provided a general layout for the team tracker, but it did not ask what specific team I wanted to track, nor did it ask what sort of sport the team tracker is for (i.e. American Football, hockey, etc.)
- The AI model missed to ask about engagement features such as polls, live fan chats from different places around the world, and a way to share what a user's screen looks like
- The AI model also did not ask if the developer wanted to also keep track of previous matches and historical matches from years past
- The AI did not ask how the developer wanted to implement live tracking

2. Inventions: tools the AI generated that the developer did not ask for

This details the generated results that the AI provided that were not asked for from the developer

- The AI model provided a favorite team selection tab even though the focus of this app will be only on one club/team
- The AI model provided an offline access and syncing features that were not asked for
- The AI model wanted to create a user profile management system as well as authentication

3: overall Judgement:

As it stands, the AI model has not given judgement calls based on the user's instructions and prompts. It has generated well-structured requirements and started out as the requirements for a generic web app rather than something I have specifically tailored to create. While some of the generated results came from its own thinking, overall, the AI provided useful information on how to design my application and did not sway into any form of user bias or its own generated bias
